

Amendment to the Claims:

1. (Currently Amended) Process for manufacturing a cooling channel piston which has a cooling channel approximately in the area behind a ring belt, where a piston blank is shaped at least partially in a forging process, characterized in that specifically in the approximate area of a top land, at least one circumferential shoulder projecting laterally from the piston blank is formed, behind the at least one shoulder a recess is introduced from ~~the~~ a side and then the at least one shoulder is reshaped by means of deformation such that the recess is closed by the at least one shoulder to create the cooling channel.

2. (Original) Process in accordance with claim 1, wherein the reshaping takes place by forging.

3. (Original) Process in accordance with claim 1, wherein the reshaping takes place by swaging.

4. (Original) Process in accordance with claim 1, wherein the reshaping takes place by driving through a hollow form.

5. (Original) Process in accordance with claim 1, wherein the reshaping takes place by pressure rolling.

6. (Previously Presented) Process in accordance with claim 1, wherein the at least one shoulder is rigidly connected to said piston blank or to another shoulder forming a contact area.

7. (Original) Process in accordance with claim 6, wherein the contact area is reworked.
